El equipo del [programa sobre «El impacto global de las enfermedades animales» \(GBADs\)](#) está dedicado al mejor entendimiento de nuestros sistemas ganaderos y de sus impactos positivos o negativos en la sociedad y el medioambiente local, nacional y mundial. Hay una necesidad urgente de desarrollar sistemas de inteligencia capaces de mejorar la toma de decisiones de las personas involucradas en la gestión ganadera con el fin de limitar las consecuencias medioambientales y los riesgos de salud pública vinculados con la producción ganadera y el consumo, ayudando a su vez a que la población mundial tenga acceso a proteína y micronutrientes de alta calidad producidos de manera humana.

Comment

Roll-out of the Global Burden of Animal Diseases programme

With continuing population growth and rising demand for food, livestock and aquaculture are integral to improving food and nutrition security, health, and livelihoods. These populations are being undermined, however, by rising concentrations of livestock production and consumption on society and the environment—ag production of greenhouse gases, environmental degradation, emergence of zoonotic diseases, and increased antibiotic resistance. The excessive consumption of some livestock products is linked to risk of non-communicable diseases.¹

There is little evidence available for addressing these concerns, and no agreed approach for assessing the animal health system's impact on human health, animal health systems, and no systematic approach to understanding global livestock populations and the resources invested in animals for societies globally. Knowledge of the major interactions on disease transmission and the ways to address them are insufficient, and there is a need for robust assessments of the impact of livestock on food security, disease risk, and climate change. In 2012, the Global Burden of Animal Diseases (GBADs) programme was launched to address these vital issues.²

Since that time, we have made progress in developing a comprehensive framework for characterizing livestock production systems that value the economic, social, and environmental benefits and risks in production and societal expenditure on animal health issues (figure). The GBADs programme recognizes that many animal health problems are related to production systems and that need to be resolved in a socioenvironmental context.

An important organizational development has been the integration of the World Organization for Animal Health (OIE) into the team of partners of the programme. This role for the OIE's 2030 mandate to improve understanding of the economic impacts of animal diseases and gain an important institutional platform for the GBADs programme. Through ongoing OIE partners, GBADs will also link with the Food and Agriculture Organization of the UN (FAO), and the International Livestock Research Institute.

GBADs will focus initially on making global estimates of animal disease burdens; over time, this will be strengthened with in-depth country, disease, and

sector-level studies. The GBADs programme now has strong engagement with research groups in Australia, Ethiopia, Indonesia, Mexico, the Netherlands, Norway, Ireland, and the US and involving national government agencies and international organizations. The team has included leading experts from both public and private multinational companies involved in pharmaceuticals, livestock production, and data management in livestock systems.

The GBADs programme has themes that will describe where, how, by whom, and why animals are kept in populations and production systems. This theme will generate and integrate information on the biomass of animals in livestock systems, the disease burden at the level of individual animals and the infrastructure used to manage them. Levels of production will be compared with a state with no disease and perfect health and compared with an idealized state. The Animal Health and Disease Study³ (the AHD) will then be centralized to specify causes through animal health ontology and attribution. The AHD will account for loss and damage to health and welfare of animals and the impact of lost animal health in the wider economy and trade and on human health. To support the latter we will collaborate closely with the Institute for Health Metrics and Evaluation (IHME). The GBADs programme's members will be supported by a range of partners, governments, the private sector, and non-governmental organizations. Additionally, education programmes will be established that provide a global knowledge framework to assess the socioenvironmental impacts of animal health systems.

In this way, GBADs will provide information to public and private sector decision-makers, adding value to their management of animal health and welfare.

Major disease challenges for the future are two of the major threats facing humanity: threats with which
